Dedicated to Prof. Antonín Holy on the occasion of his $75^{\text {th }}$ birthday in recognition of his outstanding contributions to the area of nucleic acid chemistry.

A method for the synthesis of 7 -substituted 3 - $\beta$-D-ribofuranosyl-3 H -imidazo[2,1i]purines has been devised whereby compounds were prepared in a few steps from a common intermediate, 3-(2',3'- $O$-isopropylidene- $\beta$-D-ribofuranosyl)-3H-imidazo[2,1-i]purine-7-carbaldehyde, obtained from the reaction of $2^{\prime}, 3^{\prime}-O$-isopropylideneadenosine with bromomalonaldehyde. The formyl group of the carbaldehyde was subsequently reductively aminated and the resulting secondary amines were then further derivatized either by acylation, lactamization or reductive alkylation.

Keywords: nucleosides; purine bases; NMR

Purine nucleosides and their congeners have found applications in medicinal research as antivirals ${ }^{1,2}$, antiprotozoal agents ${ }^{3}$, adenosine receptor agonists ${ }^{4-6}$, adenosine kinase inhibitors ${ }^{7,8}$ and in the treatment of lymphoid malignancies ${ }^{9-12}$ and systemic mastocytosis ${ }^{13}$, just to name a few examples. Although the structural analogs of purine nucleosides have for this reason been the subject of extensive synthetic studies, there is still room for further modifications. We now report on the preparation of 7 -substituted 3-( $\beta$-D-ribofuranosyl)-3H-imidazo[2,1-i]purines to expand the structural diversity of purine-derived compounds. The rationale for the preparation of these compounds is that whilst the structures closely resemble adenosine, the nitrogen atoms analogous to the $N^{6}$ and N-1 atoms in adenosine are blocked. These moieties of adenosine are usually engaged in H-bonding with the target protein. It is hoped that this blocking will lead to improved selectivity, since it is expected that only a limited number of potential targets are able to bind these compounds efficiently as ligands.

As an extension of our previous studies on solid-supported derivatization of 3substituted 3 H -imidazo[2,1-i] purine-7-carbaldehydes ${ }^{14,15}$, a solution-phase synthesis for
related nucleoside analogs, 7 -substituted 3 - $\beta$-D-ribofuranosyl-3 H -imidazo[2,1-i]purines, was developed. The compounds were prepared in a few steps from a common intermediate, 3 -(2',3'-O-isopropylidene- $\beta$-D-ribofuranosyl)-3H-imidazo[2,1-i]purine-7carbaldehyde (2), obtained by reacting $2^{\prime}, 3$ '- $O$-isopropylideneadenosine (1) with bromomalonaldehyde (Scheme 1). In this sequence, the formyl group was first reductively aminated with piperidine (3a), morpholine (4a), benzylamine (5) or tertbutyl 4-aminobutanoate (7). The resulting secondary amines (5 and 7) were then derivatized either by acetylation (6), lactamization (8) or reductive alkylation (9) after which the isopropylidene protecting group was removed.

Scheme 1

## RESULTS AND DISCUSSION

Formylethenoadenosine
(3- $\beta$-D-ribofuranosyl-3 H -imidazo[2,1-i]purine-7carbaldehyde) ${ }^{16}$ and its $2^{\prime}$-deoxy analog ${ }^{17}$ have been previously synthesized by the reaction of bromomalonaldehyde with adenosine in aqueous solution and 2'deoxyadenosine in DMF, respectively. Both methods, however, only provided low yields of their respective product carbaldehydes. By contrast, ethyl and tert-butyl 2-(7-formyl-3H-imidazo[2,1-i]purin-3-yl)acetates have been obtained by solution-phase synthesis in good yields ${ }^{15}$ by applying the anhydrous conditions previously ${ }^{14}$ optimized for solid-support chemistry. However, the reaction of unprotected adenosine under similar conditions produced only a thick dark product mixture that was difficult to fractionate into pure products. Protection of the $2^{\prime}$ and $3^{\prime}$ hydroxyl groups of the ribose moiety with an isopropylidene group to yield $2^{\prime}, 3^{\prime}-O$-isopropylideneadenosine (1)
markedly improved the situation. This approach thereby facilitated the production of the desired target compound, 3-(2',3'-O-isopropylidene- $\beta$-D-ribofuranosyl)-3H-imidazo[2,1-i]purine-7-carbaldehyde (2), in $81 \%$ yield after analogous reaction followed by purification using silica gel chromatography.

The conditions applied previously ${ }^{14}$ for the reductive amination of a formyl group on a solid support were found to be too harsh to be used in solution-phase synthesis. For example, treatment with sodium cyanoborohydride in THF containing $1 \%$ formic acid was found to give a product mixture where the reduced starting material was the main component (data not presented). The replacement of formic acid with acetic acid reduced the amount of this side product but still did not lead to a generally satisfactory result. Only when using benzylamine as the nucleophile was the obtained yield of the amination product $\mathbf{5}$ sufficiently acceptable. Sodium triacetox yborohydride in DCE was found to produce less byproducts and thus it was used for the amination of $\mathbf{2}$ with piperidine, morpholine and tert-butyl 4-aminobutanoate to obtain, respectively, compounds 3a, 4a and 7. Of the secondary amines, $\mathbf{5}$ was subjected to acetylation and $\mathbf{7}$ to lactamization and alkylation. Although the treatment of $\mathbf{5}$ with acetic anhydride esterified the $5^{\prime}$-hydroxyl group in addition to the secondary nitrogen atom, the $5^{\prime}-\mathrm{O}$ acetyl group could be selectively removed by the application of sodium hydride in methanol. Finally, acidolytic removal of the isopropylidene protection then yielded the desired nucleoside 6.

NMR spectroscopic examination of $\mathbf{6}$ revealed that it existed as two interconverting conformations in solution as evidenced by the cross-signals present in an EXSY spectrum between corresponding protons in the major and minor species. Compound $\mathbf{6}$ contains an acetamide moiety and thus it is expected to have restricted rotation about the
amide bond. The structural assignment of these conformers was based on quantum mechanical (QM)-calculated energies and QM-predicted ${ }^{13} \mathrm{C}$ NMR chemical shifts, both of which indicated that the conformer having the carbonyl oxygen trans to the benzyl group (conformer A, the major species) was preferred ( $\Delta G=12 \mathrm{~kJ} \mathrm{~mol}^{-1}$ ) over the conformer with cis orientation (conformer B), see Fig. 1.

Figure 1.

Compound 7 was first converted to a carboxylic acid by TFA promoted removal of the tert-butyl group under anhydrous conditions and the exposed $\gamma$-aminobutyric acid moiety was then lactamized in dilute solution using 2-(1H-benzotriazol-1-yl)-1,1,3,3tetramethyluronium hexafluorophosphate (HBTU) as an activator and $\mathrm{N}, \mathrm{N}$ diisopropylethylamine as the base. Finally, the isopropylidene protecting group was also removed to obtain 8. Alternatively, compound 7 was also subjected to reductive benzylation with benzaldehyde in DCE using zinc-modified $\mathrm{NaCNBH}_{3}{ }^{18}$ as the reducing agent. Of note, the reaction was found to be very slow using either $\mathrm{NaBH}(\mathrm{OAc})_{3}$ or $\mathrm{NaCNBH}_{3}$ without zinc chloride addition and, furthermore, the addition of acetic or formic acid instead brought about the formation of acylated and lactamized side products ${ }^{19}$. The product (9) was acidolytically deprotected to yield compound 10.

All the synthetic processes described above involved the removal of the $2^{\prime}, 3^{\prime}-O-$ isopropylidene protection as the last step. Of note, this step, somewhat unexpectedly, was found to be a rather difficult one. Of the numerous methods attempted, including $80 \%$ aqueous AcOH at $25{ }^{\circ} \mathrm{C}^{20}, \mathrm{I}_{2} / \mathrm{MeOH}^{21}, \mathrm{PdCl}_{2}\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{2}{ }^{22}, \mathrm{CAN}^{23}, \mathrm{CAN}-\mathrm{SiO}_{2}{ }^{24}$,
and hydrolysis at pH 2 , many were found to be too inefficient whilst harsher treatments such as $80 \%$ aqueous AcOH at reflux ${ }^{20}$ or a $1: 1$ mixture of 1 m HCl (aq.) and $\mathrm{THF}^{25}$, resulted in side reactions such as depurination or even pyrimidine ring opening. The best results were obtained using a $1: 1$ mixture of 0.1 m HCl (aq.) and THF at $55^{\circ} \mathrm{C}$ or $\mathrm{FeCl}_{3} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ in a $1: 19$ mixture of MeOH and DCM at elevated temperature ${ }^{26}$. The Brønsted acid-catalyzed reaction, however, was still accompanied by some depurination whilst the Lewis acid-catalyzed reaction, though cleaner, was hampered by a more laborious work up that resulted ultimately in reduced yields. The former method was therefore mainly used since it was more convenient, faster and approximately equally yielding as the latter.

In conclusion, a method to produce 7 -substituted 3 H -imidazo[2,1-i]purines on solid support was successfully adapted to solution chemistry to produce 7 -substituted 3 - $\beta$-D-ribofuranosyl-3H-imidazo[2,1-i]purines. Because of the different nature of the reaction media, several modifications to the reaction conditions were necessitated. In addition, the use of a protecting group for the ribose ring of the starting material was required. Unfortunately, the isopropylidene protection was more stable than expected which reduced the yields of the acid labile end products. For further developments, it could be worthwhile to thus evaluate other protection strategies.

## EXPERIMENTAL

Solvents and reagents were dried or tested for dryness before use when appropriate. The purified products existed as transparent glassy solids after rotary evaporation except compound $\mathbf{2}$ which was a white solid.

NMR spectra, at 298.1 K (uncorrected) unless otherwise indicated, were recorded on Bruker Avance spectrometers with field strengths of 14.1, 10.75 and 9.4 T. General NMR experimental details (e.g. standard gradient-selected COSY, HMBC and HSQC) have been described elsewhere ${ }^{27}$. NMR samples in solvents as indicated consisted of dilute samples ( $\sim 5 \mathrm{mg}$ in ca. 0.6 mL ) up to concentrated samples ( $\sim 50 \mathrm{mg}$ in ca. 0.6 $\mathrm{mL}) .{ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ chemical shifts were referenced internally to the solvent peaks ${ }^{28}$ (DMSO: $\delta_{\mathrm{H}}=2.50, \delta_{\mathrm{C}}=39.52 \mathrm{ppm} ; \mathrm{MeOH}: \delta_{\mathrm{H}}=3.31, \delta_{\mathrm{C}}=49.00 \mathrm{ppm}$; and $\mathrm{HOD}, \delta_{\mathrm{H}}=$ 4.79 ppm ) or to TMS in the case of $\mathrm{CDCl}_{3}$ solutions ( $\delta=0 \mathrm{ppm}$ for both ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ ). ${ }^{15} \mathrm{~N}$ chemical shifts were referenced externally to $90 \%$ nitromethane in $\mathrm{CD}_{3} \mathrm{NO}_{2}(\delta=0$ ppm). Assignment of the $\mathrm{H}-5$ 's ${ }^{29}$ (proR and proS) and isopropylidene methyl ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ nuclei ${ }^{30}$ (endo and exo) were derived from literature. Direct observations of the ${ }^{15} \mathrm{~N}$ nuclei were facilitated by the QDEPT pulse sequence adapted ${ }^{31}$ from methodology ${ }^{32,33}$ developed for one-bond ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ interactions. The method of cycling the ${ }^{1} \mathrm{H}$-selection pulse and the $J$-dependent interpulse delays, scaled accordingly to span the range 24.1-4.7 Hz , was taken from Jiang ${ }^{33}$. In the case of dilute samples, indirect ${ }^{15} \mathrm{~N}$ observations were taken from HMBC spectra (appropriately only reported to one decimal place). ${ }^{15} \mathrm{~N}$ chemical shifts were in accordance with previous examinations ${ }^{27 a, b, 34}$ with shielded resonances for sp ${ }^{3}$-type nitrogens ( $\mathrm{N}-3, \mathrm{~N}-6$ ) and deshielded resonances for $\mathrm{sp}^{2}$-type nitrogens ( $\mathrm{N}-1, \mathrm{~N}-4, \mathrm{~N}-9$ ).

Geometry optimizations, frequency calculations and chemical shielding calculations using GIAO were performed using the Gaussian09W program ${ }^{35}$ at the restricted B3LYP/6-31G(d,p) level of theory for all calculations with inclusion of methanol as the solvent using the IEF-PCM model.

A Bruker ESI-QTOF mass spectrometer was used for the measurement of high resolution mass spectra.

3-(2,3-O-Isopropylidene- $\beta$-D-ribofuranosyl)-3H-imidazo[2,1-i]purine-7carbaldehyde (2)

2',3'-O-Isopropylideneadenosine ( $\mathbf{1}, 0.50 \mathrm{~g}, 1.63 \mathrm{mmol}$ ) and bromomalonaldehyde $(0.37 \mathrm{~g}, 2.44 \mathrm{mmol})$ were dissolved in a mixture of formic acid $(0.19 \mathrm{~mL}, 5.01 \mathrm{mmol})$, 2,6-lutidine ( $0.53 \mathrm{~mL}, 4.57 \mathrm{mmol}$ ) and dry DMF ( 9.3 mL ). The reaction mixture was agitated in a stoppered bottle at $60^{\circ} \mathrm{C}$ for 6 h during which time the color of the mixture turned a dark orange. The reaction was monitored by TLC $\left(10 \% \mathrm{MeOH} / \mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$ and upon completion, the volatiles were removed by a rotary evaporator and the residue taken up in DCM followed by extraction with saturated $\mathrm{NaHCO}_{3}$. The organic phase was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and then evaporated to dryness after filtration. The crude material was purified by silica gel column chromatography ( $5 \% \mathrm{MeOH}$ in DCM ) yielding $0.47 \mathrm{~g}(81 \%)$ of $\mathbf{2}$. Some batches contained minor amounts of a fluorescent intensely orange-colored byproduct. The impurity was not characterized.
${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, d_{6}$-DMSO): $10.00 \mathrm{~s}, 1 \mathrm{H}\left(\mathrm{H}-1{ }^{\prime \prime}\right) ; 9.91 \mathrm{~s}, 1 \mathrm{H}(\mathrm{H}-5) ; 8.74 \mathrm{~s}, 1 \mathrm{H}$ (H-2); $8.58 \mathrm{~s}, 1 \mathrm{H}(\mathrm{H}-8) ; 6.33 \mathrm{~d}, 1 \mathrm{H}, J=2.6\left(\mathrm{H}-1 \mathrm{I}^{\prime}\right) ; 5.40 \mathrm{dd}, 1 \mathrm{H}, J=6.2,2.6\left(\mathrm{H}-2^{\prime}\right) ;$ $5.12 \mathrm{br}, 1 \mathrm{H},(\mathrm{OH}) ; 5.03 \mathrm{dd}, 1 \mathrm{H}, J=6.2,2.6\left(\mathrm{H}-3^{\prime}\right) ; 4.29 \mathrm{dt}, 1 \mathrm{H}, J=4.9,2.6\left(\mathrm{H}-4^{\prime}\right)$; $3.59 \mathrm{dd}, 1 \mathrm{H}, J=-11.8,4.9\left(\mathrm{H}^{\prime} 5^{\prime}{ }^{\text {pros }}\right) ; 3.55 \mathrm{dd}, 1 \mathrm{H}, J=-11.8,4.9\left(\mathrm{H}^{\prime} 5^{\prime}{ }^{\text {proR }}\right.$ ) $; 1.56 \mathrm{~s}, 3$ $\mathrm{H},\left(\mathrm{H}-7^{\prime}{ }_{\text {endo }}\right) ; 1.34 \mathrm{~s}, 3 \mathrm{H},\left(\mathrm{H}^{\prime} 7^{\prime}{ }^{\text {exo }}\right.$ ). ${ }^{13} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, d_{6}$-DMSO): 179.17 (C-1"), 147.83 (C-8), 144.71 (C-9a), 142.22 (C-2), 140.96 (C-3a), 136.76 (C-5), 124.72 (C-7), 122.99 (C-9b), 113.13 (C-6'), 90.12 (C-1'), 87.23 (C-4'), 84.07 (C-2'), 81.36 (C-3'),

7-(Piperidin-1-ylmethyl)-3- $\beta$-D-ribofuranosyl-3H-imidazo[2,1-i]purine (3b)

Compound 3a ( $34.2 \mathrm{mg}, 70.0 \mu \mathrm{~mol}$ ), $\mathrm{FeCl}_{3} \cdot 6 \mathrm{H}_{2} \mathrm{O}(37.8 \mathrm{mg}, 0.140 \mathrm{mmol})$ and $\mathrm{MeOH}(50 \mu \mathrm{~L})$ in $\mathrm{DCM}(950 \mu \mathrm{~L})$ were refluxed first for 7 h and then allowed to stand at room temperature overnight. One eq. of $\mathrm{FeCl}_{3} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ was then added and refluxing was continued for a few hours until the reaction was complete as indicated by TLC ( $10 \% \mathrm{MeOH}$ in DCM). Aqueous $\mathrm{NaHCO}_{3}(1 \mathrm{~mL}$, half-saturated solution) was then added under stirring followed by evaporation to dryness. The residue containing the deprotected product $\mathbf{3 b}$ and ferric hydroxide was suspended in aqueous MeOH and mixed with silica gel followed by evaporation of the solvent. The product $\mathbf{3 b}$ was eluted from the silica gel with $20 \% \mathrm{H}_{2} \mathrm{O}$ in MeCN by suction-filtration and then further purified by HPLC $\left(0-50 \% \mathrm{MeOH} / \mathrm{H}_{2} \mathrm{O}, 0.1 \mathrm{TFA}, 250 \times 21.2 \mathrm{~mm}, 5 \mu \mathrm{~m}\right.$ Hypersil ODS2, UV detection at $\lambda=220 \mathrm{~nm}$ ). Yield $23 \mathrm{mg}(65 \%)$ of $\mathbf{3 b}$ as a TFA salt. ${ }^{1} \mathrm{H}$ NMR (500 MHz, $d_{6}$-DMSO): $9.21 \mathrm{~s}, 1 \mathrm{H},(\mathrm{H}-5) ; 8.57 \mathrm{~s}, 1 \mathrm{H},(\mathrm{H}-2) ; 7.44 \mathrm{~s}, 1 \mathrm{H},(\mathrm{H}-8) ; 6.05 \mathrm{~d}$, $1 \mathrm{H}, J=5.7,\left(\mathrm{H}-1{ }^{\prime}\right) ; 5.60 \mathrm{br}, 1 \mathrm{H},(\mathrm{OH}) ; 5.33 \mathrm{br}, 1 \mathrm{H},(\mathrm{OH}) ; 5.12 \mathrm{br}, 1 \mathrm{H},(\mathrm{OH}) ; 4.60-$ $\left.4.62 \mathrm{~m}, 1 \mathrm{H},\left(\mathrm{H}-2^{\prime}\right) ; 4.18-4.22 \mathrm{~m}, 1 \mathrm{H},\left(\mathrm{H}-3^{\prime}\right) ; 3.98-4.00 \mathrm{~m}, 1 \mathrm{H},(\mathrm{H}-4)^{\prime}\right) ; 3.87 \mathrm{~s}, 2 \mathrm{H},(\mathrm{H}-$

3-(2,3-O-Isopropylidene- $\beta$-D-ribofuranosyl)-7-(morpholinomethyl)-3H-imidazo[2,1$i]$ purine (4a)

The synthesis was performed as described for 3a except that morpholine ( $48.4 \mu \mathrm{~L}$, 0.556 mmol ) was substituted for piperidine. The reaction was monitored by TLC ( $10 \%$ MeOH in DCM ) and upon completion, the reaction mixture was stirred with aqueous $\mathrm{NaHCO}_{3}$ prior to evaporation. The crude material was purified by silica gel column chromatography ( $10 \% \mathrm{MeOH} / \mathrm{CH}_{2} \mathrm{Cl}_{2}$ ) yielding 0.116 g ( $97 \%$ ) of $\mathbf{4 a} .{ }^{1} \mathrm{H}$ NMR ( 600 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): 9.16 \mathrm{~s}, 1 \mathrm{H},(\mathrm{H}-5) ; 8.18 \mathrm{~s}, 1 \mathrm{H},(\mathrm{H}-2) ; 7.50 \mathrm{~s}, 1 \mathrm{H},(\mathrm{H}-8) ; 6.07 \mathrm{~d}, 1 \mathrm{H}, J=$ 4.5, (H-1'); $5.24 \mathrm{dd}, 1 \mathrm{H}, J=5.9,4.5$, (H-2'); $5.16 \mathrm{dd}, 1 \mathrm{H}, J=6.0,1.6,\left(\mathrm{H}-3^{\prime}\right) ; 4.60-$ $4.56 \mathrm{~m}, 1 \mathrm{H}, J=1.9,\left(\mathrm{H}^{\prime} \mathbf{4}^{\prime}\right) ; 4.05 \mathrm{dd}, J=-12.4,2.1,\left(\mathrm{H}-5^{\prime}{ }^{\prime}{ }^{\prime}{ }^{\prime}\right)$ ) $3.89 \mathrm{dd}, 1 \mathrm{H}, J=-12.4$, 2.0, (H-5'pror); $3.88 \mathrm{~d}, 1 \mathrm{H}, J=14.1\left(\mathrm{H}-1 \mathrm{1}^{\prime \prime}\right) ; 3.84 \mathrm{~d}, 1 \mathrm{H}, J=14.1(\mathrm{H}-1$ "); $3.68 \mathrm{t}, 4 \mathrm{H}, J=$ 4.3 (H-4"); 2.49-2.42 m, 4 H (H-3"); $1.68 \mathrm{~s}, 3 \mathrm{H}$ ( $\mathrm{H}-7^{\prime}{ }_{\text {endo }}$ ); $1.40 \mathrm{~s}, 3 \mathrm{H}\left(\mathrm{H}^{\prime} 7^{\prime}{ }^{\text {exo }}\right.$ ). ${ }^{13} \mathrm{C}$ NMR (151 MHz, $\mathrm{CDCl}_{3}$ ): 142.23 (C-9a), 140.45 (C-2), 137.62 (C-3a), 135.71 (C-5), 133.99 (C-8), 125.31 (C-9b), 119.88 (C-7), 114.35 (C-6'), 93.71 (C-1'), 86.15 (C-4'), 83.95 (C-2'), 81.66 (C-3'), 66.84 (C-4"), 63.20 (C-5'), 53.40 (C-3"), 52.60 (C-1"), 27.60 (C-7'endo), 25.34 (C-7'exo). ${ }^{15} \mathrm{~N}$ NMR ( $50 \mathrm{MHz}, d_{6}$-DMSO): -206.05 (N-3), -179.18 (N6), $-152.39(\mathrm{~N}-4),-150.7(\mathrm{~N}-9),-137.86(\mathrm{~N}-1), \mathrm{N}-1$ " not observed. 7-[(N-Acetyl- $N$-benzyl)aminomethyl]-3- $\beta$-D-ribofuranosyl-3H-imidazo[2,1-i]purine (6)

Compound 5 ( $20.5 \mathrm{mg}, 45.5 \mu \mathrm{~mol}$ ), acetic anhydride ( $0.500 \mathrm{~mL}, 5.29 \mathrm{mmol}$ ) and pyridine $(0.200 \mathrm{~mL}, 2.48 \mathrm{mmol})$ were stirred in $\mathrm{DCM}(4.5 \mathrm{~mL})$ until all of the starting material had been consumed according to TLC monitoring ( $10 \% \mathrm{MeOH}$ in DCM). The reaction mixture was then evaporated to dryness and the residue taken up in DCM and extracted with saturated $\mathrm{NaHCO}_{3}$. The organic phase was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and again evaporated to dryness after filtration. The remaining mixture of acetylated products was
dissolved in dry MeOH ( 1.0 mL ) containing sodium hydride ( $60 \%$ dispersion in mineral oil, $3.0 \mathrm{mg}, 75 \mu \mathrm{~mol}$ ). When deacetylation of the hydroxyl groups was complete, the mixture was diluted with DCM and extracted with $3 \%$ aq. $\mathrm{KH}_{2} \mathrm{PO}_{4}$. The organic phase was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent removed after filtration. The product was purified by silica gel column chromatography ( $5 \% \mathrm{MeOH} \mathrm{DCM}$ ) yielding 16.5 mg ( $74 \%$ ) of $\mathbf{6}$. The isopropylidene protection was removed as described for $\mathbf{4 b}$ and the deprotected material purified by silica gel column chromatography $\left(10 \% \mathrm{H}_{2} \mathrm{O} / \mathrm{MeCN}\right)$ yielding $11 \mathrm{mg}(53 \%$ from $\mathbf{5})$ of $\mathbf{6}$. 3-(2,3-O-Isopropylidene- $\beta$-D-ribofuranosyl)-7-\{[N-(4-tert-butoxy-4-oxobutyl)- $N$ benzyl]aminomethyl $\}$-3H-imidazo[2,1-i]purine (9)

Compound 7 ( $35.2 \mathrm{mg}, 70.0 \mu \mathrm{~mol}$ ) and benzaldehyde ( $14.3 \mu \mathrm{~L}, 0.140 \mathrm{mmol}$ ) were dissolved in dry $\mathrm{MeOH}(0.40 \mathrm{~mL})$ to which $\mathrm{ZnCl}_{2}(9.5 \mathrm{mg}, 70.0 \mu \mathrm{~mol})$ and $\mathrm{NaCNBH}_{3}$
$(85 \%, 10.4 \mathrm{mg}, 0.140 \mathrm{mmol})$ in dry $\mathrm{MeOH}(0.20 \mathrm{~mL})$ were added followed by stirring for 28 h . The reaction was monitored by TLC ( $10 \% \mathrm{H}_{2} \mathrm{O} / \mathrm{MeCN}$ ) and by ESI-MS analysis. Upon completion of the reaction, saturated aq. $\mathrm{NaHCO}_{3}(0.20 \mathrm{~mL})$ and water $(0.3 \mathrm{~mL})$ were added and the mixture extracted with DCM , after which the water phase was concentrated to near dryness and some MeCN added. The volatiles were removed and the product purified by silica gel column chromatography $\left(2.5 \% \mathrm{H}_{2} \mathrm{O} / \mathrm{MeCN}\right)$ yielding $37.4 \mathrm{mg}(90 \%)$ of $9 .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $8.87 \mathrm{~s}, 1 \mathrm{H}(\mathrm{H}-5) ; 8.26 \mathrm{~s}, 1$ H (H-2); $7.48 \mathrm{~s}, 1$ H (H-8); 7.36-7.29 m, 2 H (H-4"'); 7.29-7.19 m, 3 H (H-2"', H-3'"); $6.12 \mathrm{~d}, 1 \mathrm{H}, J=4.1\left(\mathrm{H}-1^{\prime}\right) ; 5.24 \mathrm{dd}, 1 \mathrm{H}, J=6.0,4.1\left(\mathrm{H}-2^{\prime}\right) ; 5.17 \mathrm{dd}, 1 \mathrm{H}, J=6.0,1.5$ (H-3'); 4.58-4.55 m, $\left.1 \mathrm{H}, J=2.1(\mathrm{H}-4)^{\prime}\right) ; 4.05 \mathrm{dd}, 1 \mathrm{H}, J=-12.3,2.2\left(\mathrm{H}^{\prime} 5^{\prime}{ }^{\prime}{ }^{\prime}\right.$ ros $) ; 3.91 \mathrm{dd}$, $1 \mathrm{H}, J=-12.3,2.5\left(\mathrm{H}-5^{\prime}\right.$ pror $) ; 3.90 \mathrm{~d}, 1 \mathrm{H}, J=14.3\left(\mathrm{H}-1{ }^{\prime \prime}\right) ; 3.86\left(\mathrm{~d}, 1 \mathrm{H}, J=14.3\left(\mathrm{H}-1^{\prime \prime}\right)\right.$; $3.63 \mathrm{~d}, 1 \mathrm{H}, J=13.3$ (H-1'"); $3.58 \mathrm{~d}, 1 \mathrm{H}, J=13.3$ (H-1'"); $2.54-2.42 \mathrm{~m}, 2 \mathrm{H}\left(\mathrm{H}-3^{\prime \prime}\right)$; 2.16-2.06 m, 2 H (H-5"); 1.87-1.75 m, 2 H (H-4"); $1.68 \mathrm{~s}, 3 \mathrm{H}$ ( $\mathrm{H}^{-7}{ }^{\prime}{ }_{\text {endo }}$ ); $1.41 \mathrm{~s}, 3 \mathrm{H}$ ( $\mathrm{H}-7{ }^{\prime}$ exo) ; $1.36 \mathrm{~s}, 9 \mathrm{H}\left(\mathrm{H}-9{ }^{\prime \prime}\right) .{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): 172.61 (C-6"), 141.95 (C9a), 140.36 (C-2), 138.25 (C-2"'), 137.78 (C-3a), 135.71 (C-5), 133.66 (C-8), 129.23 (C3"'), 128.60 (C-4"'), 127.49 (C-5'"), 124.76 (C-9b), 121.18 (C-7), 114.21 (C-6'), 93.27 (C-1'), 86.48 (C-4'), 84.27 (C-2'), 81.79 (C-3'), 80.42 (C-8"), 63.09 (C-5'), 58.43 (C-1'"), 53.01 (C-3"), 48.06 (C-1"), 33.17 (C-5"), 28.10 (C-9"), 27.60 (C-7'endo), 25.40 (C-7'exo), 22.13 (C-4").
