Endocytosis is a general mechanism of the host cell to transport cargo molecules such as membrane components, fluid and solutes into the cytoplasm and out from the cell (Ewers and Helenius, 2011, Pelkmans and Helenius, 2003).

Endocytosis is a general way for cells to carry substances into the cell interior and back to the surrounding environment.

Endocytosis is a general mechanism of the host cell to transport cargo molecules such as membrane components, fluid and solutes into the cytoplasm (Ewers and Helenius, 2011, Pelkmans and Helenius, 2003).

Endocytosis is a general way for cells to carry substances into the cell interior.
